Deploying and Administering AD DS

There are components in Active Directory Domain Services. In the root domain, the physical components are on the top side of the Active Directory Domain trees. There are domain controllers, data stores, and global catalog servers. In the logical portion, the partition is in the database. The administrators have contained the schema, configuration, and domain in each database/ data stores. The Organizational Units are in the middle of the domain along with the users and computers containers at the bottom. The Adatum.com is the forest root domain, while LON-DC1.Adatum.com, LON-DC3.Adatum.com, and LON-SVR1.Adatum.com are the tree root domains.
