

Deploying and Administering AD DS

Eli Chang

MSSA Cohort #2

Lab Summary 1

2/28/2020

### Deploying and Administering AD DS

The diagram seems similar to the diagram from the last lab assignment, but the LON-DC1 has the child domain as a research group. First, this Active Directory forest is in the trust relationship, there are other child domains as well, but they are not in the diagram because the lab did not mention anything about them. The user and computer object on the bottom of the child domain is in the global group, which collects members based on the members' roles, which is the research group. One is the administrators, while the other is the Helpdesk team. Both OUs are in the bigger group for the domain-local group so that it can provide management of resource access assigned. Unlike the last diagram, it also has the key symbol, which represents the security identifier (SID). Since they are in the security group, they could be given permissions as well as email access.
