Managing User Settings With Group Policy

There were some limitations to show everything on the diagram, but the folder redirection could be in the diagram. In the computer, the specific application should be installed and configured as planned. There are three organizational units at the first level: Research, Security, and Account. In the next level, resources and lab OUs are under research GPO; resources OU is under security OU; faculty OU is under the account OU. The administrative templates are the tool to manage user settings. In the account OU, the faculty has three folders: Application data, document, and start menu. These folders would be in the faculty account in any computers within the network.

Settings for configuring folder redirection are advanced folder redirection option because the folder location is based on the group membership. There are several options for this setting: none, basic, advanced, and follow the document folder. Only faculties would have specific folders. Other users would not have these folders on their computers.
